Cambodia has established 2 marine protected areas. One of the MPAs, Ream National Park has coral reef within the boundaries. According to Reef At Risk report, the information on the distribution and condition of Cambodia's coral reefs is still very limited. Most corals are found on rocky bases and a few are organized into fringing reef formations (Burke et al. 2002)

The study indicates that the total area of MPA sites in Cambodia is 1,922.5 km². Cambodia has 1,127 km of coastline with very little of coral reef area, 50km². The management of coral reef conservation is not well developed in Cambodia. Coral harvesting was an important threat until 1997, but controls have tightened and corals have been confiscated from vendors (Wilkinson 2004).

Both Cambodia's MPAs were established within 15 years ago (Figure 1). The MPAs are managed at the national level (Figure 2). There are no published information on no-take area and effectiveness of MPAs in Cambodia.
